Week 8 — Binary Search Tree

1.

2.

$$log_2(n)$$

 $log_2(1000) = 9.97$

So about 10 steps to search a value in a well-balanced BST with 1000 elements

3.

```
int greatestVal(Node* root){
   if (root == nullptr) throw runtime_error("Empty tree"); // base case 1 - tree is empty so
   throw error
   if (root->right == nullptr) return root->val; // base case 2 - reached rightmost node (max
   value)
   return greatestVal(root->right); // recursively keep going right
}
```

```
#include <iostream>
1
 2
    #include <vector>
    using namespace std;
 3
 4
 5
    struct Node{
        int val;
                        // value stored in the node
 6
 7
        Node* left;
                        // pointer to the left child
 8
        Node* right;
                        // pointer to the right child
 9
        // constructor to initialize a node
10
        Node(int val): val(val), left(nullptr), right(nullptr){}
11
12
    };
13
    // insert a new value into the BST
14
    Node* insert (Node* root, int x){
15
        if (!root) return new Node(x);
                                             // if tree is empty, create a new node
16
17
        if (x < root->val){
                                             // if value is smaller, go to the left
18
            root->left = insert(root->left, x);
                                             // if value is larger or equal, go to the right
        } else {
19
20
            root->right = insert(root->right, x);
21
22
        return root;
                         // return the root pointer
23
    }
24
25
    // print values in sorted order
26
    void printTree(Node* root){
27
        if (!root) return; // base case: nothing to print
        printTree(root->left);
                                 // left subtree
28
        cout << root->val << " "; // print current node value</pre>
29
                                    // right subtree
30
        printTree(root->right);
31
    }
32
33
    int main(){
34
        vector<int> nums = {1, 5, 9, 2, 4, 10, 6, 3, 8};  // list of nums
        Node* root = nullptr; // new node initialized to null
35
36
        // insert all numbers into the BST
37
38
        for(int x : nums){
            root = insert(root, x);
39
40
        }
41
        cout << "Tree" << endl;</pre>
42
43
        printTree(root);
44
45
        return 0;
46
47 }
```
